

The optiCOLOR^{vision} Glasses as "windows of the soul"

Nearly 80 percent of all impressions reach our brain via the eyes. Today, we know that this much is true – the eye is not there merely to see! It is an important "outpost" of our health. The eye primarily perceives light and colour. Light and colour are vibrations with various properties, meaning frequencies. The eye receives these, converts the frequencies into electromagnetic impulses, selects and sorts them, then forwards them to the brain.

The high-quality colored lenses of the **optiCOLOR^{vision}** Glasses can have effects that are beneficial to the health, in the case of emotional and physical illnesses and stress.

The harmonious stimulation of viewing colours has long been used with great success in psychology and in psychotherapy. You have the opportunity to take advantage of these experiences, and you have the freedom to self-sufficiently contribute to your well-being and your health, e.g. when you are hiking, playing sports, when relaxing and going to sleep, when you have allergies and headaches: ...simply whenever it does you good.

The 100% UV400 filter also makes them excellently suitable for use as sunglasses.

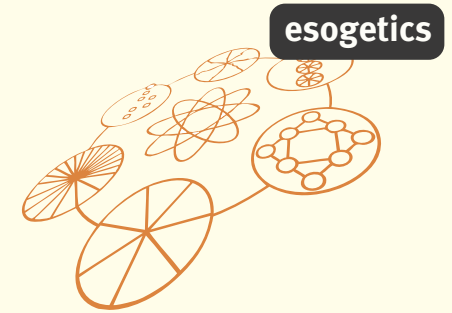

Warning:

The **optiCOLOR^{vision}** Glasses may not be worn in road traffic or when operating a machine; only the colour yellow is permitted for this.

optiCOLOR^{vision} Glasses

Quality Features:

- In 7 different colours
- Highly saturated colour-filter lenses
- For personal use and therapeutic application
- Comfortable fit
- Also suitable for children
- Fashionable – comfortable – light
- Highly resistant against scratches and shatterproof
- Colour filters of the highest quality
- UV400 Filter
- CE 89/686/CEE, Pr-En-1836: 2005
- Recommended by the International Mandel Institute

optiCOLOR^{vision}

**High-quality colored lenses
as "windows of the soul"**

Looking through the red **optiCOLOR^{vision}** Glasses

Red creates a feeling of excitement, of intensity and of exhilaration. Red makes us active and passionate. Slow and sluggish children should – in particular before doing school-work – look at the colour red. Looking through the red glasses, you will immerse your surroundings into an active light, making you feel like doing or accomplishing something. If you use the red **optiCOLOR^{vision}** Glasses for an extended period of time, over weeks or months, this will intensify your will and your incentive to become physically active, to do sports and to be ready for a contest.

Looking through the yellow **optiCOLOR^{vision}** Glasses

When we are confronted with the colour yellow, we experience a feeling of brightness and openness. In particular on gloomy, rainy days, our surroundings immediately appear friendlier. We get the impression that all the other colours in nature become richer, when viewed through the yellow **optiCOLOR^{vision}** Glasses. We are filled with a sense of lightness and serenity, and the urge to become intellectually active becomes stronger. Therefore, the yellow **optiCOLOR^{vision}** Glasses are especially suited for stimulating the learning aptitude. Dissatisfied individuals soon change their facial expressions, after looking through the **optiCOLOR^{vision}** Glasses. Yellow is one of the most important colours in this world, since it strengthens the nervous system for intellectual composure and knowledge.

Looking through the blue **optiCOLOR^{vision}** Glasses

The colour blue visually conveys a feeling of repose, silence and restraint. Exposed to the influence of blue for an extended length of time, we feel satisfaction, peace and contentment. Other effects include relaxation of the body and the creation of inner peace, as well as a readiness to sleep. Individuals suffering from headaches caused by tension or

from vegetative restlessness react excellently to the blue colour. Pressures on the stomach and cramps in the neck and spine may disappear. We are filled with a feeling of deep relaxation.

Looking through the green **optiCOLOR^{vision}** Glasses

Looking through the green **optiCOLOR^{vision}** Glasses immediately enhances your capacity to concentrate. Your surroundings appear in a special atmosphere. Green light calms and relaxes us in a special way. Unlike the deep, soothing sleepiness that we experience with the blue colour, green gives us a feeling of relaxation that removes our everyday worries, thereby enabling us to gain relaxed concentration.

Looking through the orange **optiCOLOR^{vision}** Glasses

Test subjects react strongly and intuitively to this colour. The optimism brought about by orange, and the resulting enjoyment of life, blows weariness and listlessness away and automatically increases an individual's ambition. The rhythm between waking and sleeping can be improved with the orange colour. The cheerfulness experienced by looking through the orange glasses allows you to see your everyday worries from a different angle. Orange is a blessing for the mind.

Looking through the violet **optiCOLOR^{vision}** Glasses

No other colour is able to create a new world for the observer in the same way that violet does. At first it is an unreal world, in which all the colours of one's natural surroundings are suddenly subjected to a different, new reality. The observer feels that images from the depths of his own soul are surging towards the surface. Everyone who has used the violet glasses wanted to be exposed to this new condition for as

long as possible. The violet glasses also help to intensify or to become tuned to meditation. Violet conveys inner strength, intuition and inspiration.

Looking through the turquoise **optiCOLOR^{vision}** Glasses

Up until now, the effects of this colour had not been researched. It was first introduced by Esoteric medicine as a therapy colour and designated as a "lift to the deep consciousness". Looking through the turquoise **optiCOLOR^{vision}** Glasses stimulates a very specific emotional reverie. One recalls occurrences from the past that had long been locked away from consciousness. They are often the key to present conflicts. If these memories are dealt with, this also generally indicates the solution of the resulting conflict. The turquoise **optiCOLOR^{vision}** Glasses demonstrate particular effectiveness in the case of allergic reactions, such as hay fever.

...also available are:

OPTICOLOR^{PC/TV} Glasses

There are also special PC/TV glasses from the **optiCOLOR** series called **optiCOLOR^{PC/TV}** Glasses. They provide reliable special color-filter protection against excessive blue-light radiation screens, fluorescent lamps, white-light LED and energy-saving lamps, and they are therefore particularly suited for watching television and for PC work in the office. This takes the burden off your eyes and increases your sense of well-being.
